The material is not intended as an offer or solicitation for the purposes of any financial instrument, is not intended to provide an investment recommendation and should not be relied upon for such. The material is derived from published sources, together with personal research. No responsibility or liability is accepted by the author or International Iron Metallics Association or any of its members for any such information or opinions or for any errors, omissions, mis-statements, negligence or otherwise for any further communication, written or otherwise.
Presentation overview

- What are ore-based metallics (OBM’s)?
- How are they used?
- How and where are they produced?
- What are their principal markets?
- Analysis of cross-border trade
- Market structure and dynamics
- Price information
What are ore-based metallics?

They are various forms of iron, manufactured principally by the reduction of iron ore in blast furnaces and direct reduction plants, also from the smelting of titanium-bearing mineral sands, and used as feedstock in the iron & steel and iron casting industries:

pig iron, hot briquetted iron (HBI), direct reduced iron (DRI), granulated pig iron
How are they used?

- In the steel industry, the principal application is as ferrous feedstock for steel produced in electric arc furnaces (EAF) as a supplement to steel scrap, the principal feedstock material.
- Outside China, EAF share of steel production shows a gradual upward trend.
- Being manufactured from iron ore, ore-based metallics have a very low content of residual metallic and other impurities such as copper, tin, zinc, etc. This is the principal, but not the only benefit of OBM’s.
- As such, they enable production of higher quality steels, such as flat products, via the EAF route by dilution of the impurities in the scrap.
- Pig iron is an essential feedstock material for production of certain grades of cast iron in foundries, due to its clean analysis.
Residual impurities in scrap and OBM’s

### Fragmented scrap from incineration
- **E46**: ≤ 0.500 ≤ 0.070

### Ore-based metallics *
- pig iron, DRI, HBI 0.002 trace Σ ≤ 0.015

* Dependent on source iron ore
How is pig iron produced?

- Pig iron is produced principally by the reduction of iron ore in a blast furnace, using coke or charcoal as reductant. In integrated steel mills, liquid iron (hot metal) is transferred directly to the steel plant for refining into steel.

- For the merchant market, liquid iron is cast into ingots which when cooled can be delivered to customers. Merchant pig iron is produced:
  - by dedicated merchant plants selling only cold pig iron
  - by integrated steel mills which sell surplus iron to the merchant market in the form of cold pig iron

- High Purity Pig Iron (HPPI) is produced by smelting ilmenite, a titanium-bearing mineral, in electric furnaces. This is a niche form of pig iron, used for production of ductile iron castings.

- Granulated pig iron is manufactured by the rapid solidification of liquid blast furnace iron in water to form granules.
Where is merchant pig iron produced?

- The principal producing countries outside China are Russia, Ukraine and Brazil which account for at least 75% of market supply. Others include Japan, India, Germany and Italy.
- China is by far the world’s largest producer of merchant pig iron, but exports very little and then only to nearby markets.
- HPPI is produced in South Africa, Canada and Norway.
- Granulated iron is currently produced in Sweden and India for the merchant market.
How are DRI and HBI produced?

- **Direct Reduced Iron** is produced by the reduction of iron ore:
  - in shaft furnaces using natural gas as reductant ([Midrex](#) and [Energiron](#) are the principal processes) – about 80% of global production
  - in rotary kiln furnaces using coal as reductant (various proprietary processes), mainly in India where the product is known as “sponge iron” – about 20% of global production

- As a highly reduced form of iron, DRI is very reactive and requires special measures for safe transportation and handling.

- **Hot Briquetted Iron** is a form of DRI which is briquetted at elevated temperature to form dense briquettes which can be transported and handled easily and safely.
Where are DRI and HBI produced?

- Apart from coal-based sponge iron production in India, gas-based production of DRI occurs where there is plentiful supply of low cost natural gas:
  - Middle East (Iran, Saudi Arabia, Qatar, UAE, Bahrain, Oman) and North Africa (Egypt, Libya)
  - The Americas (Venezuela, Argentina, Trinidad, Mexico, USA and Canada)
  - Russia (there are also plants in Canada, Germany, South Africa and Indonesia)

- Due to its nature, DRI is consumed mainly in steel mills where DRI production is integrated with EAF steel production. There is a very limited merchant market for DRI.
  - Steel producer Nucor produces DRI at its plants in Trinidad and Louisiana and ships about 3 millions tonnes per year to its various steel mills in the USA

- HBI is produced principally in Russia, USA and Venezuela, the main suppliers, but also in Malaysia, Qatar and Libya.
What are the principal markets for OBM’s?

- **Outside China, the principal EAF steel markets for OBM’s are:**
  - the USA, Mexico
  - in Europe: Turkey, Italy and Spain
  - in Asia: India, South Korea, Taiwan
  - the Middle East

- **The principal foundry markets for pig iron are the major iron casting nations of China, USA, India, Germany, Japan, Russia, South Korea, Mexico, Brazil and Italy.**
Cross border trade in pig iron

INTRODUCTION TO ORE-BASED METALLICS
Distribution of pig iron exports in 2016

- Russia, 5.1
- Brazil, 2.2
- Ukraine, 2.5
- India, 0.6
- South Africa, 0.3
- Others, 1.5

Total pig iron exports 2016: 12.25 mt
Distribution of pig iron imports in 2016

- USA, 3.9
- Italy, 1.6
- Turkey, 1.1
- South Korea, 0.3
- Taiwan, 0.4
- Spain, 0.2
- Others, 4.2

Total pig iron imports in 2016: 11.75 mt
### World DRI Production

Market structure

- The market can divided into two parts logistically:
  - full ship or barge loads delivered directly to steel companies or large foundries
  - truckloads delivered from intermediate stockpiles to foundries

- In terms of supply chain, there are two principal mechanisms:
  - direct sales by producers to end users, either by direct shipment or via producer-owned stockpiles
  - sales to end users via traders and distributors, either by direct shipment or via their own stockpiles

- In practice, most business is done by traders and distributors which provide financing to the supply chain.
- Full shipload business is generally concluded on a shipment-by-shipment basis with the price being negotiated against the background of then current market circumstances.
- Distributor business is generally done either on a truckload-by-truckload basis or against a weekly, monthly or quarterly offtake schedule with the price being fixed on a monthly or quarterly basis.
- Payment terms vary from pre-shipment financing to letter of credit payment on loading of vessels to monthly credit terms for truckload business.
- Sales contracts cover delivery schedule and shipping conditions, price and payment terms, payable weight and product specifications, etc.
There are several drivers of OBM prices

First and foremost, OBM prices are driven by steel scrap prices which can vary from region to region (e.g. North America, Europe, Far East) and within regions (in USA, mid-west, south, etc.). Scrap prices are themselves driven by supply-demand factors, steel production and price levels, etc.

By virtue of their high value-in-use, OBM’s predominantly sell at a premium to scrap, but not always.

Commodity prices along the steel value chain tend to follow the same general trend over the longer term

- iron ore, coal/coke, OBM’s, scrap, steel semis, steel products

In the short term, supply-side and demand-side issues can distort traditional pricing relationships and lead to temporary changes in the main price drivers.
Main scrap trade flows

Information source: BIR
Price development along the steel value chain

Brazilian merchant pig iron price development

- Platts IODEX 62% Fe $/dmt / North China import CFR
- Pig iron / Brazil export FOB Ponta da Madeira $/t [SBB]
- FOB barge NOLA $/t [SPB]
- No. 1 Bushelling - Chicago $/t [SPB]
- Rebar / N.America domestic $/t FOB US Midwest mill [SBB]
- Flat Products / HRC / US domestic EXW Indiana $/t [SBB]
Price development along the steel value chain

HBI price development

- HBI / Venezuela export FOB Palua $/tonne [SBB]
- Shredded Scrap - Chicago $/tonne [SPB]
- HBI FOB NOLA $/tonne [SPB]
- Brazilian basic pig iron FOB NOLA [SPB]
- HBI CFR Italy $/tonne [Metal Expert]
Price references for OBM’s

- There are several reference price series published by media companies, based mainly on contacts with trade players:
  - Platts/SBB, Metal Bulletin/AMM, CRU, SteelHome, Mysteel, umetal
  - It is important to understand the basis on which prices are quoted in order to compare “apples with apples”

- There is no “scientifically” calculated index for OBM prices as for iron ore. The issue is that there is probably not sufficient trade volume and liquidity to justify the cost of creating one.

- There is a degree of correlation between OBM prices and, say iron ore and scrap prices, but are the latter suitable proxies for OBM’s?
  - IODEX, Metal Bulletin and The Steel Index for iron ore
  - LME and Steel Benchmarker for steel scrap
